# AI and the Workforce: The Teams and Talent Most Likely to Win

Ben Magnuson

DIRECTOR, DATA STRATEGY, ONE NORTH

one north A TEKsystems Company

JUST LIKE THE PHOTO IN BACK TO THE FUTURE

**BUMMERS**

# Data quality is degrading.

While data quality within organizations may be improving—data quality outside the org is on a slow descent.

## DATA DEGRADATION

# Privacy restrictions have reduced ability to track people across devices, websites, and applications

### Influences:

- 3rd party cookie deprecation
- Privacy regulations (government and private)
- Apple: Mail restrictions and “Ask Not to Track”
- Browser tit-for-tat

### Greatest Potential Impacts:

- Attribution modeling
- Reporting on which channels are most effective at improving conversions
- Increased cost to reach segments

## Conversion Attribution is going to get worse

Following factors have introduced data gaps in the users' conversion paths:

1. Restriction on [third party cookies](#).
2. Asking for users' consent for every action (because of [GDPR](#)).
3. Browser restrictions on users tracking.

## The Future of Attribution Modeling – Attribution without cookies

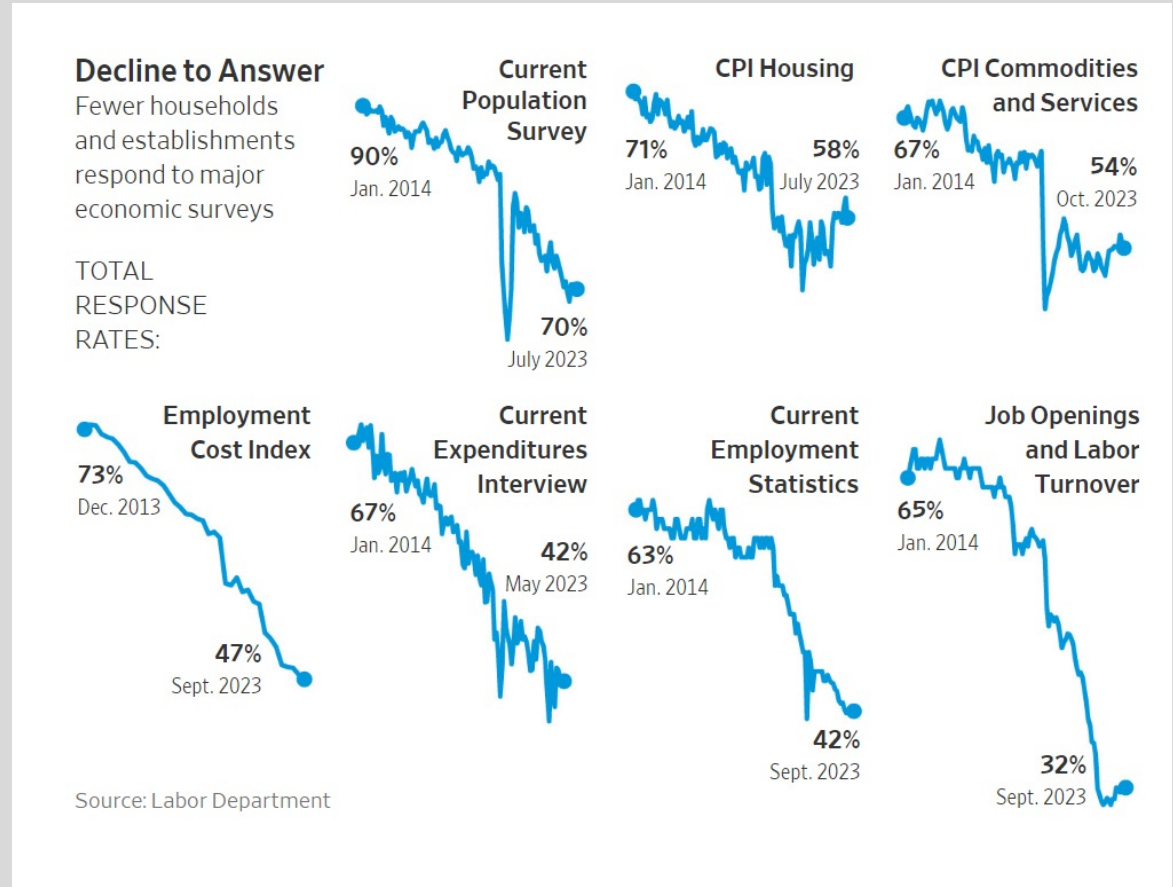

Attribution Modelling

**FAILURE TO RESPOND:**

# Survey-based research is struggling with ever declining response rates.

## Data degradation

- A trend that has been occurring for decades became *much* worse during the pandemic but has not recovered.
- Response rates aren't limited to just phone surveys, but mail and digital.

# “What’s your AI plan?”

We’ve all been in a meeting this year with this question.

And it feels like when a group of people have performed something as impressive as making it seem like computers are conversing, we should pay attention.

## Hype Cycle for Artificial Intelligence, 2023

**“The most important trait of an AI researcher is that they know a lot about AI research. Ideally, an AI researcher should have some breadth; that is, they should know at least something about a wide-ranging set of problems in multiple subdisciplines e.g., language, vision, robotics, time-series data, planning, etc.”**

## PROBLEM SOLVING

# Unkind environments create needs for a wider range of knowledge.

**As we work to transform our businesses, we need to be more confident in some areas, and less in others.**

In David Epstein's *Range*, he explores how broadening our range of experiences leads to superior problem solving in three key ways:

- **Person:** The importance of a range of experiences in life
- **Approach:** The importance of expanding your range when problem solving
- **Teams:** How bringing in range can propel your problem solving

# We are going to explore the benefits of range in three areas:

01

**The  
Person**

02

**The  
Approach**

03

**The  
Team**

And how, when combined, they provide the right mix to solve the most vexing problems.

01

# The Person

## CIRCUITOUS ROUTES TO SUCCESS

### VAN GOGH

Didn't return to painting until 27; former teacher, art dealer, and painter.

### JULIA CHILD

Served in OSS (prelude to CIA); "failed housewife;" co-authored *The Art of French Cooking* at age 49.

### RAY KROC

Lifelong salesman; did not partner with McDonalds until 52.

### CHARLES DARWIN

Medical school dropout; goes to Cambridge to study Theology before being recommended for a 5-year tour on the HMS Beagle.

# These examples are commonplace at One North.

## ME (BEN)

Journalism Major,  
started career in  
Product Support and  
Account Services

## KALEV PEEKNA

Recovering historian

## JESSICA DEJONG

New construction real  
estate before entering  
design

## JENNIFER LILL

Master's of Education  
and started career in  
Corporate Training

## Data Strategy Team

### PRATHYUSHA VEDULLA

Former electrician engineer who  
worked on semiconductor chip  
manufacturing

### BHARGAVI KASHYAP

Started in biomedical labs before  
moving to Public Relations

### PAUL LINCOLN

Energy Sales before moving into  
Marketing Agencies

# Hedgehogs v. Foxes

Philip Tetlock applied the famous framework toward forecasters:

## The Hedgehog

- Deep expertise, but narrow; some had spent careers studying a single problem.
- According to Tetlock, “[Hedgehogs] toil devotedly within one tradition of their specialty and reach for formulaic solutions to ill-defined problems.”

## The Fox

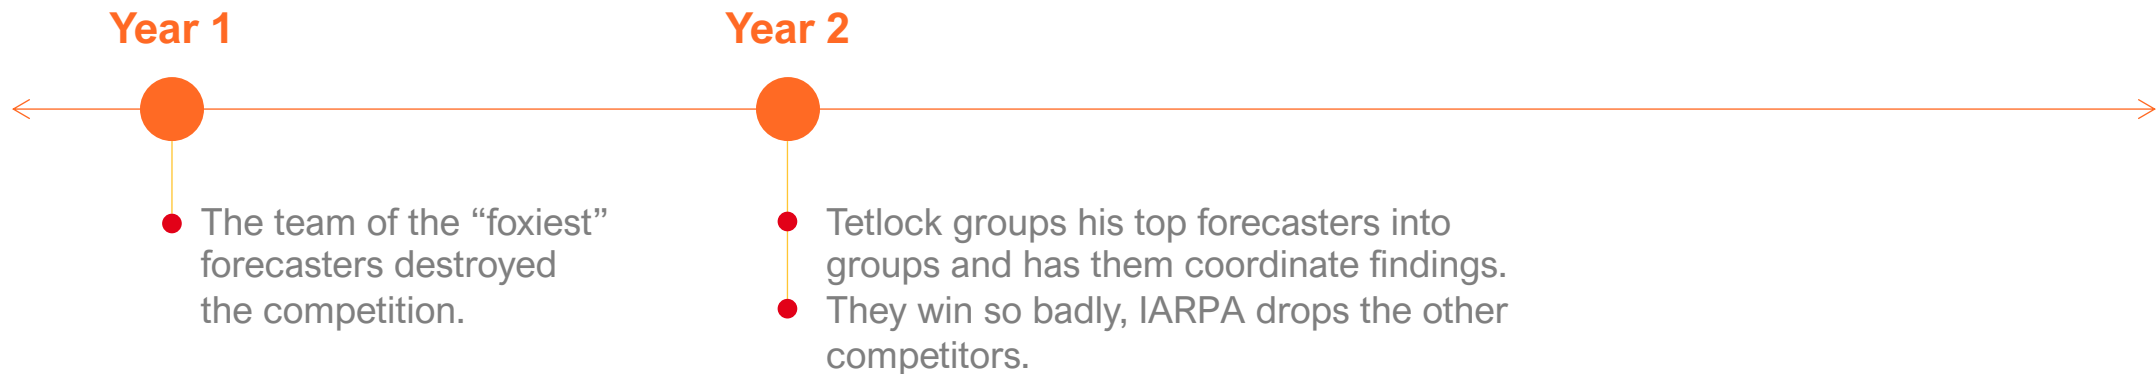

- Broad, more shallow expertise across an array of disciplines
- More accepting of ambiguity and contradiction

# When placed head-to-head in short-term and long-term forecasting, hedgehogs were terrible.

In 2011, IARPA (friend of DARPA) launched a 4-year prediction tournament:

- Five groups of researchers were encouraged to formulate a team they thought would do best at the predictions.
- Tetlock and Mellers stacked their team full of “Foxes” rather than decorated experts.

**“The volunteers drawn from the general public beat experienced intelligence analysts with access to classified data by 30 percent.”**

David Epstein

RANGE: WHY GENERALISTS TRIUMPH IN A SPECIALIZED WORLD

02

# The Approach

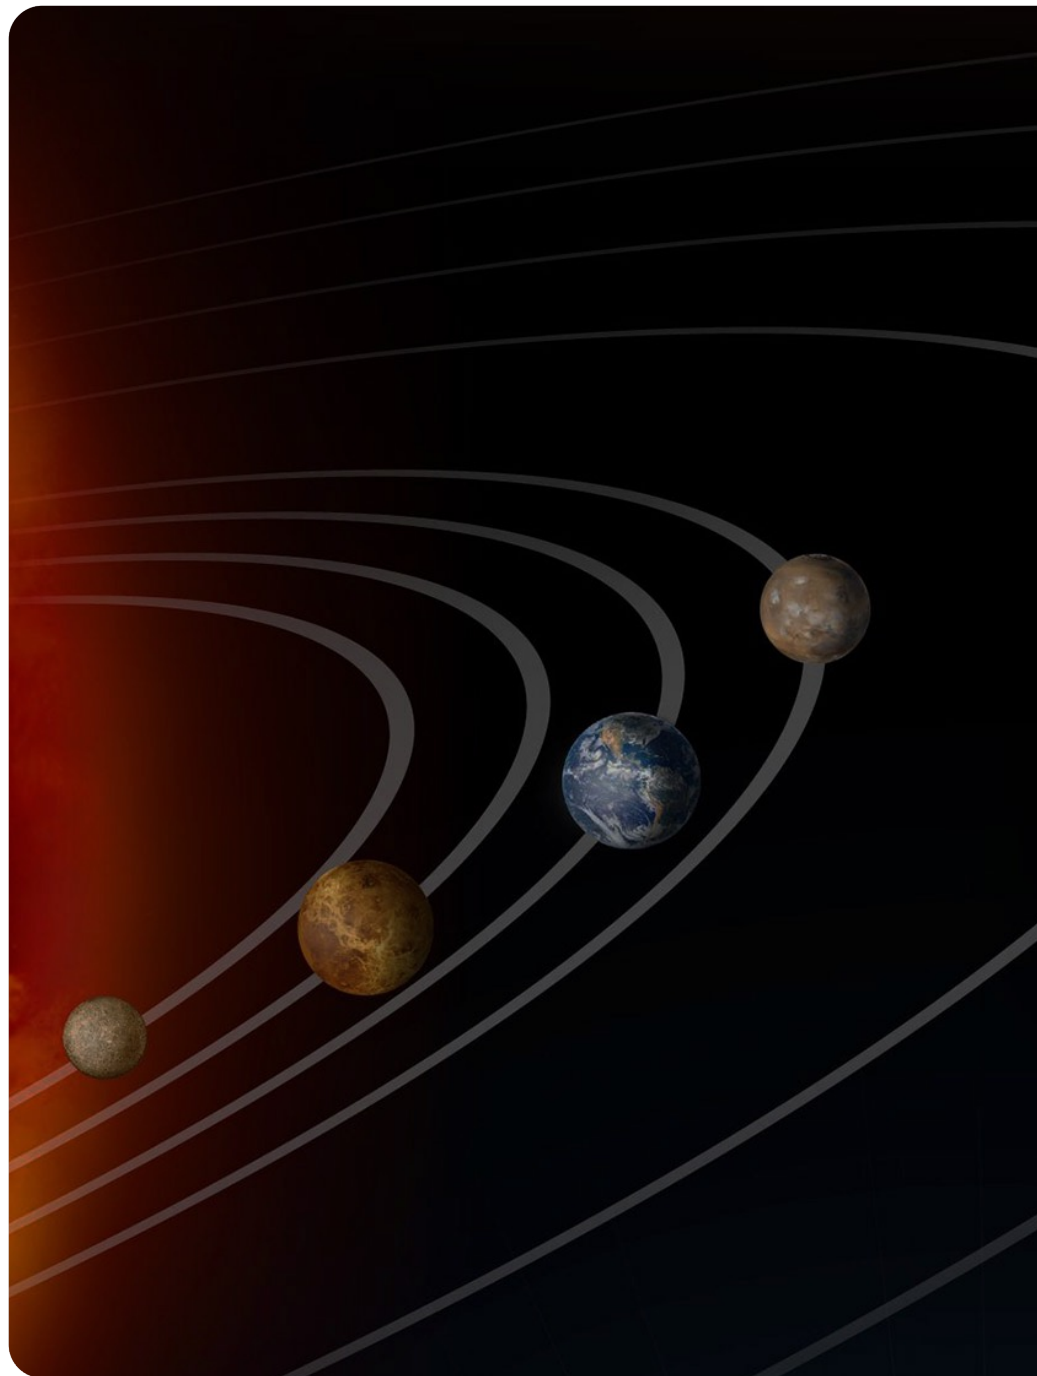

PERSON

# The power of analogy

Johannes Kepler, a 16th century astronomer, lived in a world where the available theories of planetary orbit did not fit what he could observe from Earth.

At this point, researchers knew the Earth and other planets revolved around the sun but believed them to orbit in circles at the same speed.

### **He observed...**

Planets farther from the sun orbited slower than planets closer.

### **He related it to... heat and smell**

dissipating the farther they get from the source.  
Could the sun's 'energy' be similar?

*But those have a presence?*

### **He related it to... light**

Light "appears not to exist between its source and object it lights up." If light can, what other energy?

*But light can be blocked, and an eclipse doesn't stop orbits.*

### **He related it to... magnets**

Perhaps planets have poles on either end, attracting or repelling based on where they are in their orbit.

*But they always move forward?*

### **He related it to... a whirlpool**

The sun's power creating a 'current' the planets are pulled into

*But they don't follow an ordinary path?*

**He related it to... a boatman, optics and lenses,  
balance scales, brooms**

**“Kepler’s intellectual wanderings traced a staggering journey, from planets imbued with souls riding on crystalline spheres, to his illumination of the laws of planetary motion which showed that their orbits were predictable based on their relation to the sun.”**

**More importantly,  
Kepler invented  
Astrophysics.**

PROBLEM SOLVING

# Analogical thinking breaks us out of the inside view.

In 2001, BCG created an intranet site intended to facilitate analogical thinking.

A consultant creating strategies for a merger would not see examples of AOL and Time Warner, “but of William the Conqueror’s ‘merger’ of England with the Norman Kingdom.”

Seems tedious?

# Students had to create strategies for a fake company struggling to build revenue.

Students were broken into three groups:

## GROUP 1

No analogies provided

## GROUP 2

One analogy provided in same industry

## GROUP 3

Multiple analogies provided in distant industries

# Students had to create strategies for a fake company struggling to build revenue.

Students were broken into three groups:

## THE RESULTS?

**Group 3** had the most strategies created, with the more distant the analogy the better. **Group 1** had the fewest.

Despite this, when asked how they could apply these learnings, students decided that just one analogy in a related field was best.

03

# The Team

# The benefits of building a team with range equals that of building it within our approach.

## The Study

Psychologist Kevin Dunbar began documenting how productive labs worked. In doing so, he observed two labs encountering the same problem simultaneously (he was forbidden from sharing this info between teams).

### LAB 1

**All E. coli experts**

### LAB 2

**Experts with backgrounds in Chemistry, Physics, Biology and Genetics**

**“One lab made an analogy drawing knowledge from experience with medical devices and figured it out right there in the meeting.**

**The other used E. Coli knowledge to deal with everything, and it took them weeks to uncover a solution.”**

Kevin Dunbar

PSYCHOLOGIST

# Automating self check out

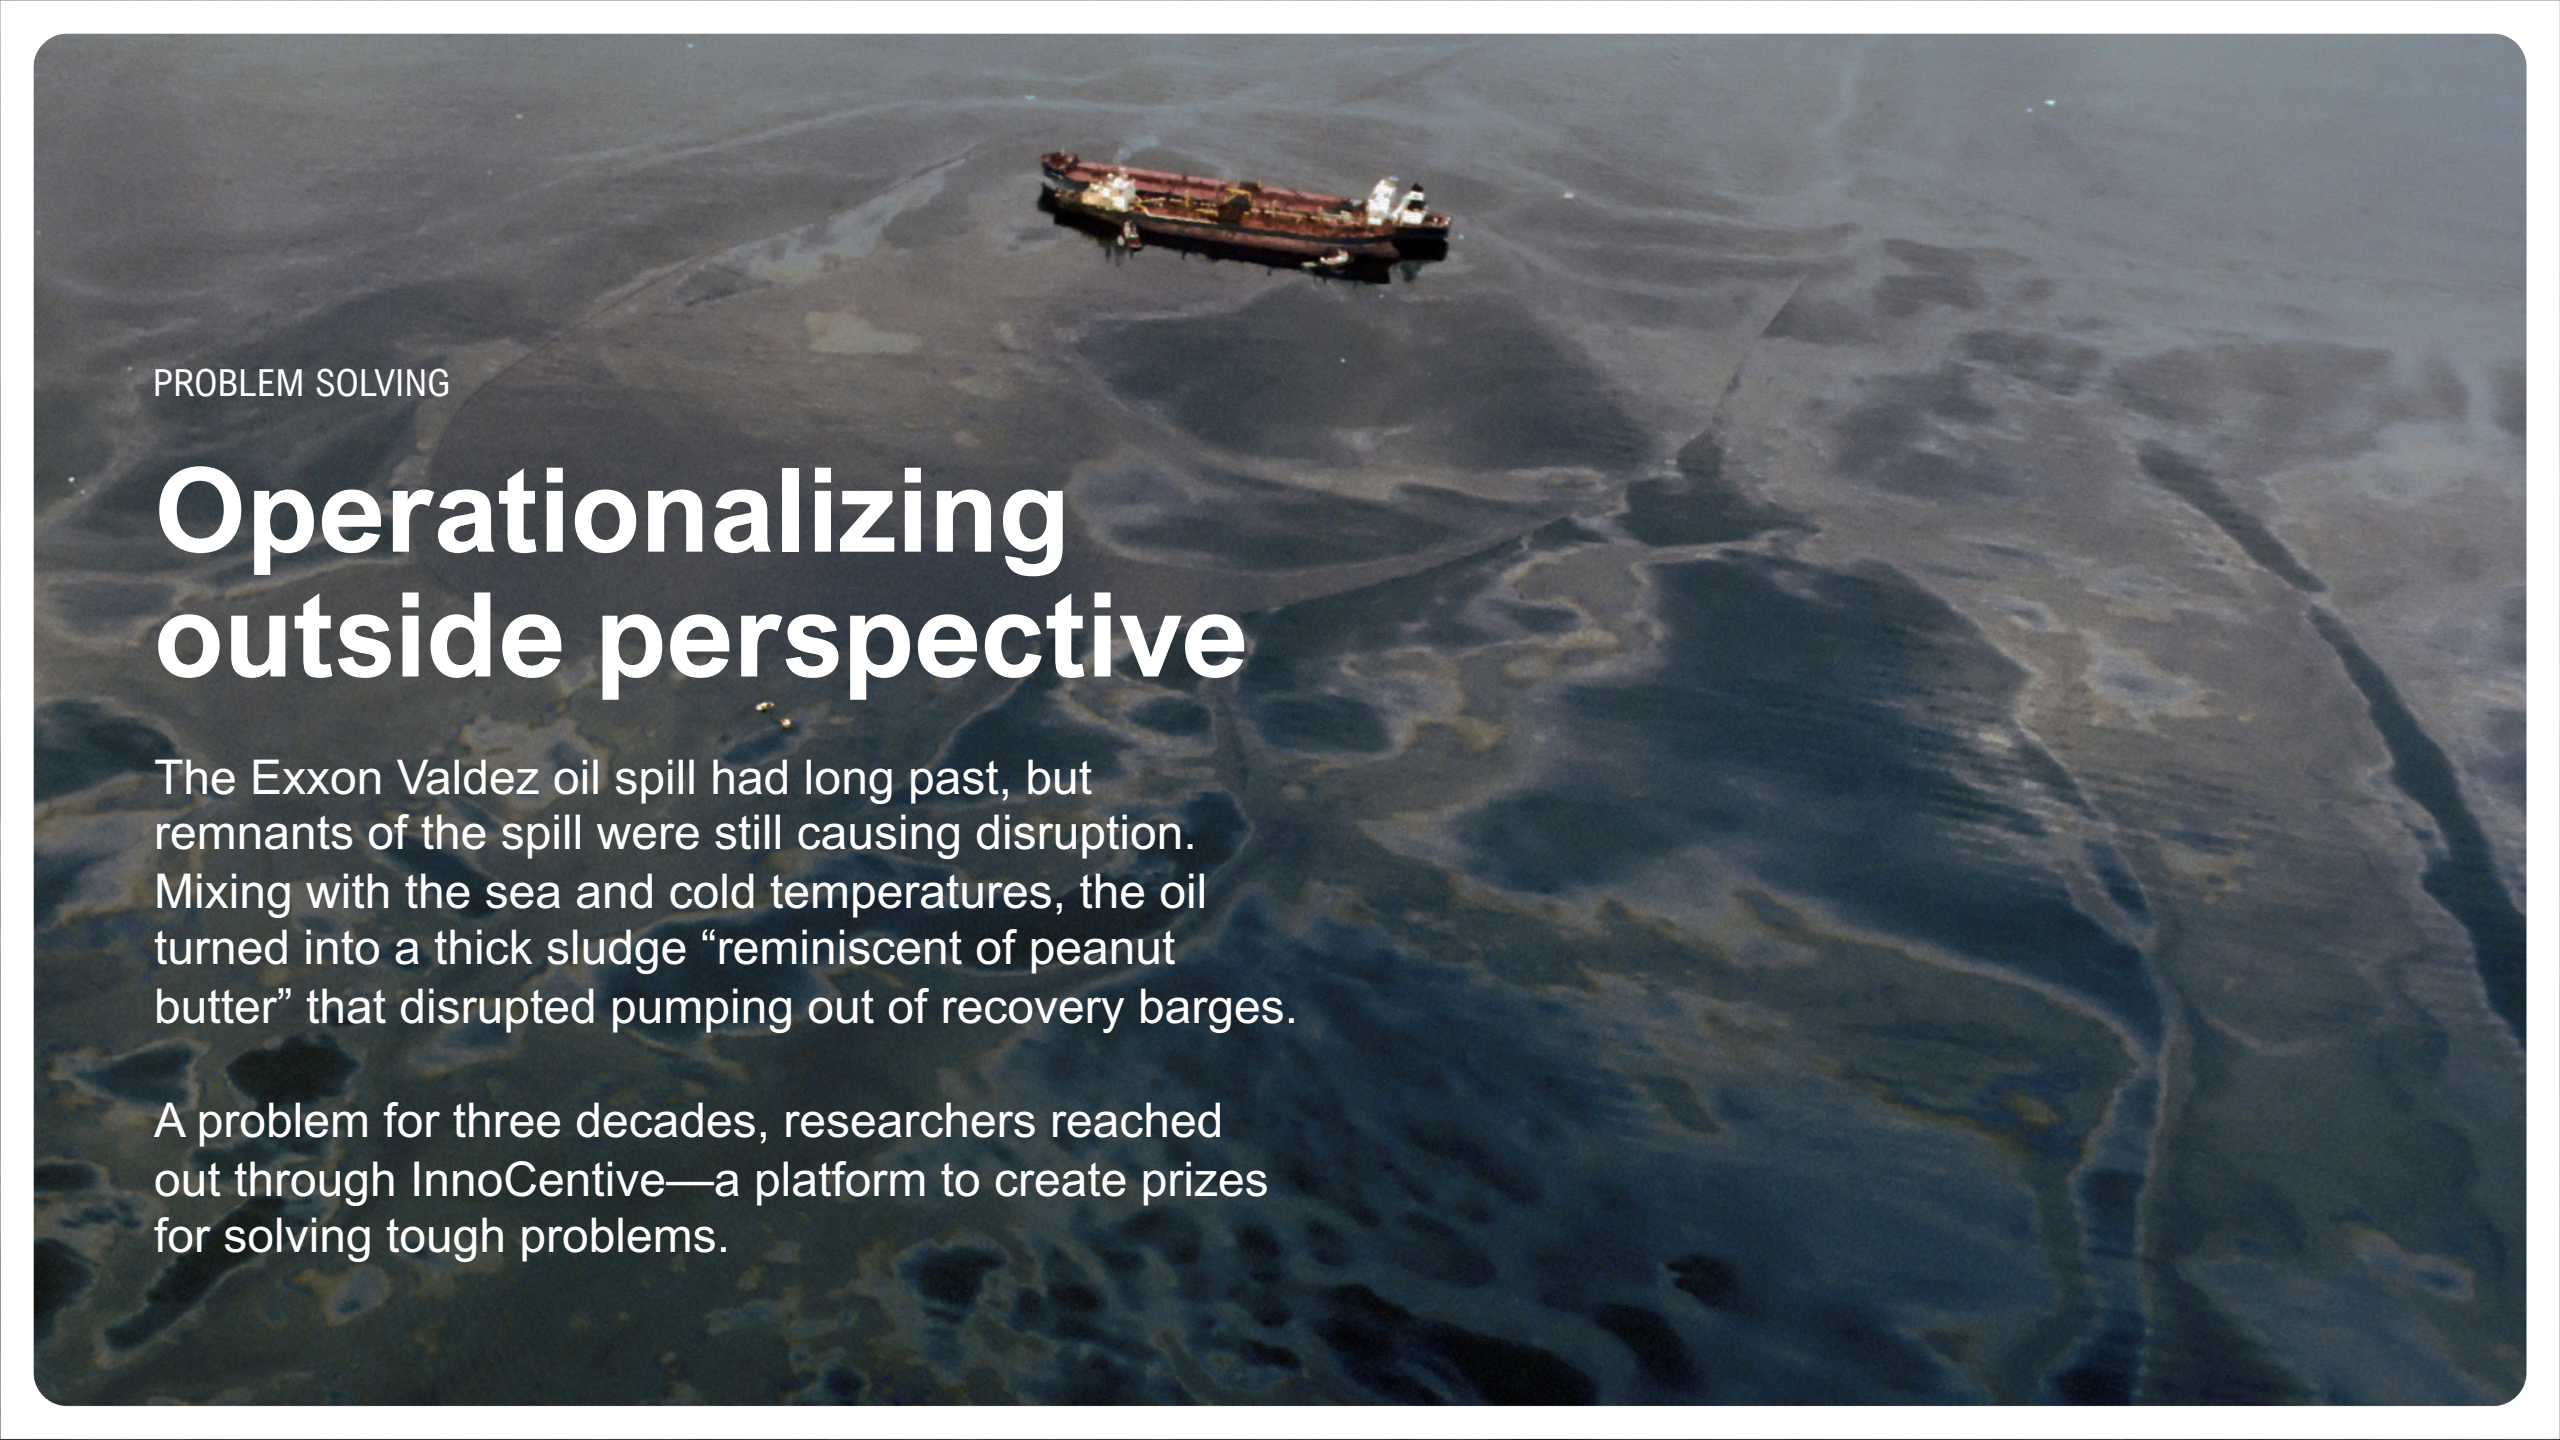

## What magic is this?

The self-checkout at Uniqlo feels like it is from a distant future, but it was brought to life by a decades-old, cheap technology.

The CIO of Fast Retailing (Uniqlo's parent) spearheaded this effort. His super power was his knowledge of logistics, and the RFID tag.

Rather than try to recreate the cashier, Takahiro Tambara used their experience of tracking inventory in and out of warehouses using radar technology and RFID tags costing just cents.

An aerial photograph showing a large-scale oil spill cleanup operation. A long, dark oil slick stretches across the water. In the center, a large red and white ship is visible, surrounded by several smaller recovery barges. The water is dark, and the overall scene is one of industrial-scale environmental remediation.

PROBLEM SOLVING

# Operationalizing outside perspective

The Exxon Valdez oil spill had long past, but remnants of the spill were still causing disruption. Mixing with the sea and cold temperatures, the oil turned into a thick sludge “reminiscent of peanut butter” that disrupted pumping out of recovery barges.

A problem for three decades, researchers reached out through InnoCentive—a platform to create prizes for solving tough problems.

**“Knowledge is a double-edged sword. It allows you to do some things, but it also makes you blind to other things that you could do.”**

Pedro Domingos

COMPUTER SCIENCE PROFESSOR & ML RESEARCHER

RANGE IN THE WILD

# Hiring for range

# What we learned from focusing on range over specialization

**01**

## **Meandering matters.**

Talk to neighbors, friends, relatives, teachers. Read, travel! These “distractions” from work may be the very thing that helps you solve your problem.

**02**

## **A design-thinking led workshop is not enough!**

Push yourself to break things down into their core characteristics, and look around for analogies on how it may be handled.

**03**

## **“Knowing the technology” isn’t enough.**

Knowing the customer, knowing the business, hopefully (for me) knowing sports will all come into play for a successful evolution of our industries.

# Thank You
